Gene expression profiles in cancer patients

[Tutorial] Gene expression profiles in cancer patients

1. Introduction

Lung cancer one of major cancers, accounting for 2.09 million deaths out of the 9.6 million total cancer deaths in 2018. There are two main types of lung cancer: small cell lung carcinoma (SCLC) and non-small cell lung carcinoma (NSCLC). NSCLC is responsible for 85–90% of lung cancer cases and its two largest subtypes are lung adenocarcinoma (LUAD) and lung squamous cell carcinoma (LUSC).

LUAD develops in the periphery of the lungs and may be associated with smoking, but is the most common lung cancer type among non-smokers. In contrast, LUSC accounts for 25–30% of all total lung cancer cases while LUAD accounts for 40% of all total lung cancer cases. LUSC are likely to be found in the middle of the lungs and is associated with smoking.

In this tutorial, we will explore the sample dataset of LUSC and LUAD from the The Cancer Genome Atlas (TCGA), a public resource for the genomic dataset. Here we use two types of lung cancers - LUAD and LUSC and will examine which information we can use for genomic analyses of lung cancers.

2. Obtain the gene expression profile dataset

To access the gene expression data, there are two ways

- 1. Formal way (but slow): you can download the data as described in 2.1
- 2. Simple ways: get the file from my dropbox link where I downloaded and save to R object as described in 2.2

2.1. Download the data from GDC portal

You will need to install the TCGAbiolinks package to obtain the lung cancer gene expression profiles from TCGA.

```
library(tidyverse)
```

```
## -- Attaching packages ------ tidyverse 1.3.1 --
## v ggplot2 3.3.5
                   v purrr
                           0.3.4
## v tibble 3.1.4
                   v dplyr
                           1.0.7
## v tidyr
          1.1.3
                  v stringr 1.4.0
## v readr
          2.0.1
                  v forcats 0.5.1
## -- Conflicts ----- tidyverse_conflicts() --
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()
                 masks stats::lag()
```

```
# Install the TCGAbiolinks package if necessary
if (!requireNamespace("BiocManager", quietly = TRUE))
 install.packages("BiocManager")
BiocManager::install("TCGAbiolinks")
## Bioconductor version 3.13 (BiocManager 1.30.16), R 4.1.1 (2021-08-10)
## Warning: package(s) not installed when version(s) same as current; use `force = TRUE` to
    re-install: 'TCGAbiolinks'
## Installation paths not writeable, unable to update packages
    path: C:/Program Files/R/R-4.1.1/library
##
##
    packages:
##
      lattice, mgcv, nlme, survival
## Old packages: 'digest', 'lubridate', 'readr', 'rlang', 'stringi', 'tibble',
    'tidyr', 'xfun'
library(TCGAbiolinks)
Then, Obtain the TCGA dataset from the GDC portal. You first download the gene expression dataset for
Lung Adenocarcinoma (LUAD).
query <- GDCquery(project = "TCGA-LUAD",
               data.category = "Transcriptome Profiling",
                data.type = "Gene Expression Quantification",
                workflow.type = "HTSeq - FPKM-UQ")
## -----
## o GDCquery: Searching in GDC database
## -----
## Genome of reference: hg38
## -----
## oo Accessing GDC. This might take a while...
## -----
## ooo Project: TCGA-LUAD
## -----
## oo Filtering results
```

```
## ooo By data.type
## ooo By workflow.type
## -----

e_luad = assay(d_luad0)
e_lusc = assay(d_lusc0)

g_luad = d_luad0@rowRanges %>% as.data.frame() %>% filter(seqnames == 'chr1') %>% pull(ensembl_gene_id)
g_lusc = d_luscO@rowRanges %>% as.data.frame() %>% filter(seqnames == 'chr1') %>% pull(ensembl_gene_id)
e_luad = e_luad[g_luad, ]
e_lusc = e_lusc[g_lusc, ]

save(d_luad, d_lusc, e_luad, e_lusc, file = 'data.TCGA_LUAD_LUSC.gene_expression.Rdata')
```

2.2. Get the file from the link

You can download the data from this link. Please save this file to the working folder. Then, load the objects to your workspace.

```
load('data.TCGA_LUAD_LUSC.gene_expression.Rdata')
```

3. Explore the input dataset

Let's explore which columns are provided in the LUAD dataset.

```
colnames(d_luad)
```

```

```

3.1. Which tissues or samples are available for your analysis?

Lung cancer samples in the dataset are provided in tumor or normal tissues. The column shortLetterCode contains Sample Type Codes to describe the type of tissues collected in the dataset.

TP: Primary solid Tumor TR: Recurrent solid Tumor NT: Solid Tissue Normal

Check which samples are included in the LUAD dataset.

```
d_luad %>% dplyr::count(shortLetterCode)
```

```
## shortLetterCode n
## 1 NT 59
## 2 TP 533
## 3 TR 2
```

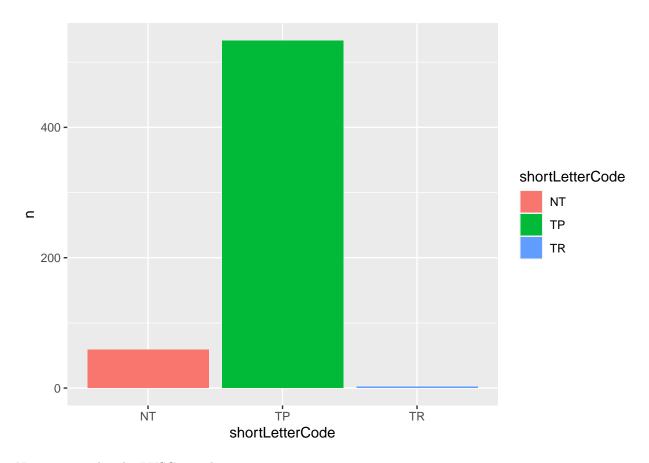

Check which samples are included in the LUSC dataset.

```
d_lusc %>% dplyr::count(shortLetterCode)
```

```
## 1 shortLetterCode n
## 1 NT 49
## 2 TP 502
```

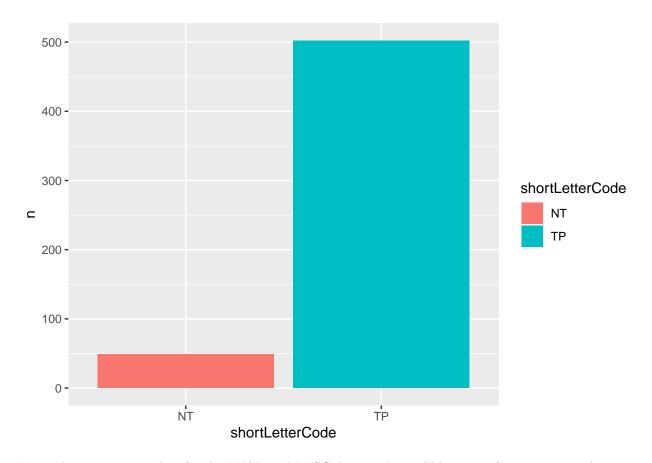

Let's make a simple bar plot to compare the number of tissues between two tissue types. We will look at the LUAD samples first.

```
d_luad %>%
  dplyr::count(shortLetterCode) %>%
  ggplot(., aes(shortLetterCode, n, fill = shortLetterCode)) +
  geom_bar(stat = "identity", position = position_dodge())
```

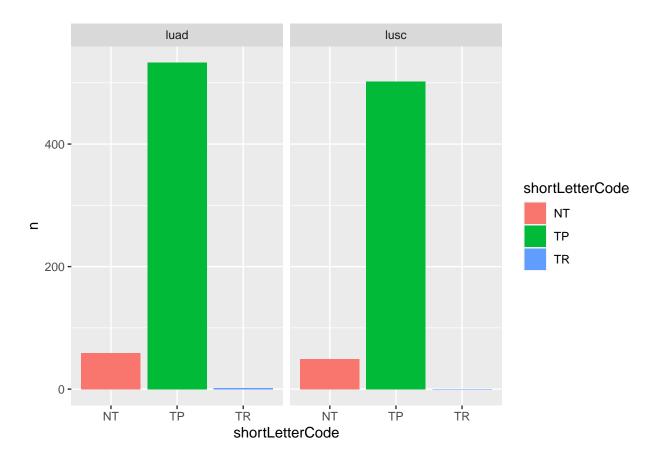

Now we can plot the LUSC samples.

```
d_lusc %>%
  dplyr::count(shortLetterCode) %>%
  ggplot(., aes(shortLetterCode, n, fill = shortLetterCode)) +
  geom_bar(stat = "identity", position = position_dodge())
```

We made two separate plots for the LUAD and LUSC dataset. It would be great if we can merge them into one plot. Here I put the code for this. It would be good practice if you comment or delete the line that you don't understand fully, you will compare the difference between outcomes. Also, please figure out what Qs do in this plot.

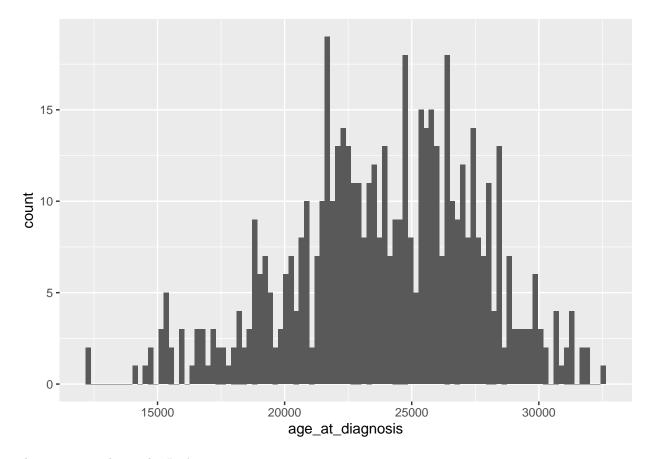

Q1: Turns implicit missing values(TR in lusc) into explicit missing values
Q2: Wraps a 1D sequence of panels into 2D

3.2. Distribution of clinical variables

We will plot the distribution of age at diagnosis using histogram. Few things you can check: - Is the distribution continuous? - Is it fowlloing the normal distribution? - What is the scale on the x-axis? - If the distribution is stratified, which makes it?

```
# Plot histogram
ggplot(d_luad, aes(age_at_diagnosis)) + geom_histogram(bins = 100)
```

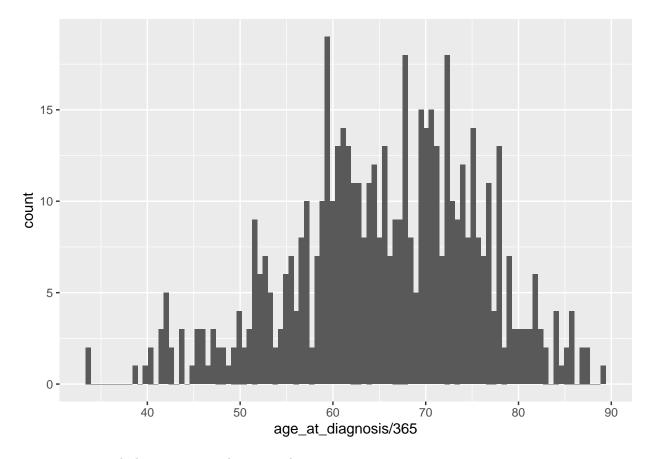

Warning: Removed 37 rows containing non-finite values (stat_bin).

The x-axis is a day scale. Let's convert it to year.

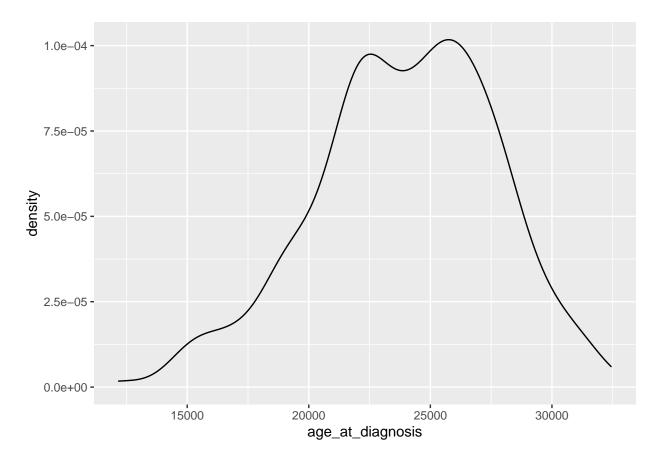

```
# Change the axis
ggplot(d_luad, aes(age_at_diagnosis / 365)) + geom_histogram(bins = 100)
```

Warning: Removed 37 rows containing non-finite values (stat_bin).

To create a smooth density, we use the geom_density.

Warning: Removed 37 rows containing non-finite values (stat_density).

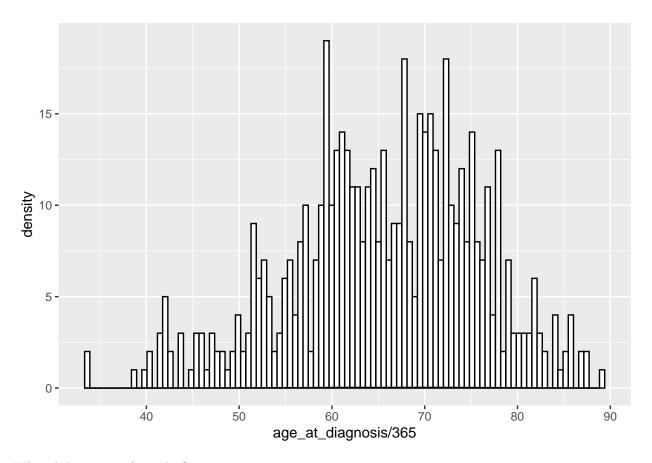

More plot types on distribution. First we can try the plot for both histogram and density.

```
# Plot both histogram and density plot
ggplot(d_luad, aes(age_at_diagnosis / 365)) +
  geom_histogram(bins = 100, colour = "black", fill = "white") +
  geom_density(alpha = .2, fill = "#FF6666")
```

Warning: Removed 37 rows containing non-finite values (stat_bin).

Warning: Removed 37 rows containing non-finite values (stat_density).

What did you miss from this?

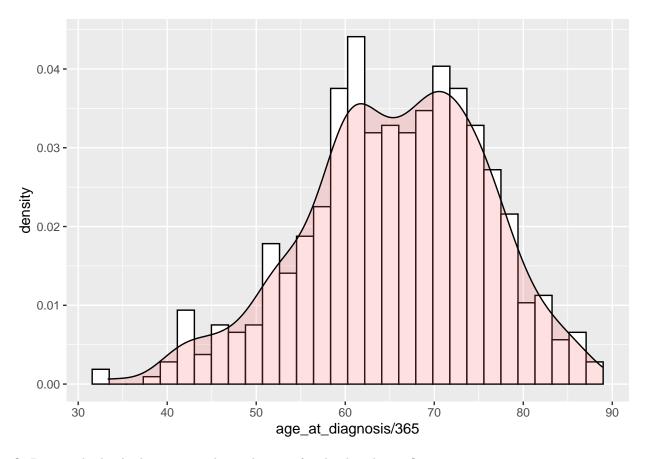

Let's plot a bit different version. We will replace the y-axis of the histogram with the y-axis of the density plot.

```
# Histogram with density plot
ggplot(d_luad, aes(age_at_diagnosis / 365)) +
   geom_histogram(aes(y = ..density..), colour = "black", fill = "white") +
   geom_density(alpha = .2, fill = "#FF6666")

## `stat_bin()` using `bins = 30`. Pick better value with `binwidth`.

## Warning: Removed 37 rows containing non-finite values (stat_bin).

## Warning: Removed 37 rows containing non-finite values (stat_density).
```

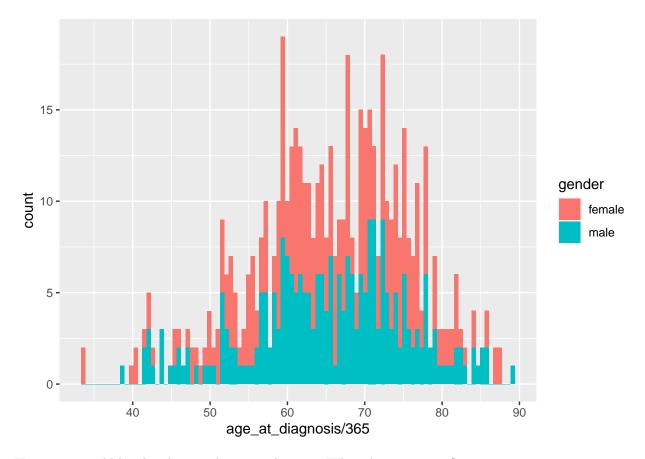

Q: Do you think whether it is good visualization for the distribution?

From the plot above, we still found the bump around the center. What would contribute to this stratification? Let's look at some variables from other columns. First we can try information from the gender column.

```
ggplot(d_luad, aes(age_at_diagnosis / 365, fill = gender)) + geom_histogram(bins = 100)
```

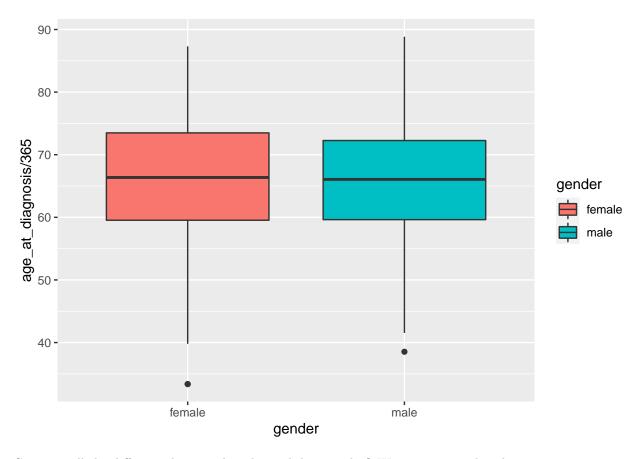

Warning: Removed 37 rows containing non-finite values (stat_bin).

Histogram would be okay but not best visualization. What else we can try?

```
ggplot(d_luad, aes(gender, age_at_diagnosis / 365, fill = gender)) +
  geom_boxplot()
```

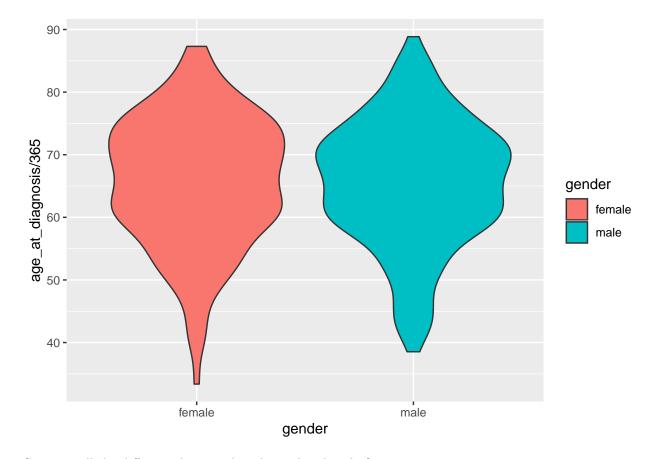

Warning: Removed 37 rows containing non-finite values (stat_boxplot).

Can you tell the difference between boxplot and density plot? We can try a violin plot.

```
ggplot(d_luad, aes(gender, age_at_diagnosis / 365, fill = gender)) +
  geom_violin()
```

Warning: Removed 37 rows containing non-finite values (stat_ydensity).

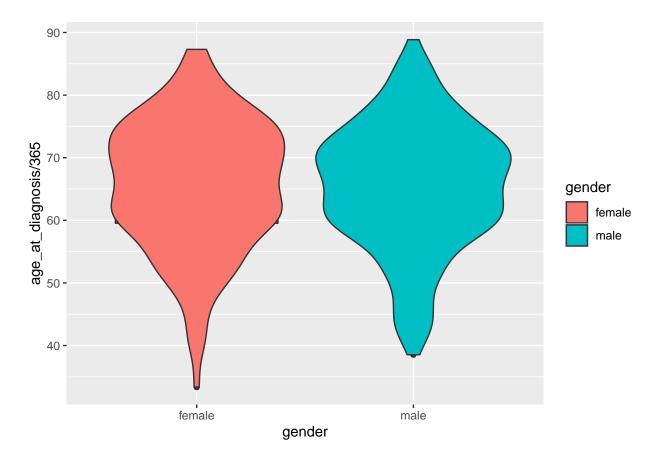

Can you tell the difference between boxplot and violin plot?

```
ggplot(d_luad, aes(gender, age_at_diagnosis / 365, fill = gender)) +
  geom_boxplot() +
  geom_violin()
```

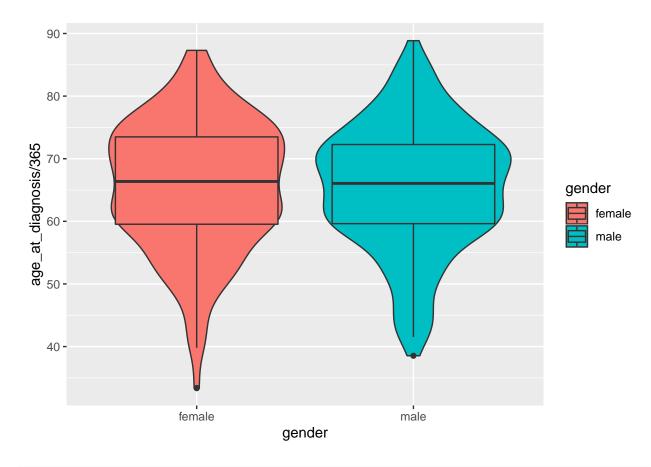

Warning: Removed 37 rows containing non-finite values (stat_boxplot).

Warning: Removed 37 rows containing non-finite values (stat_ydensity).

```
ggplot(d_luad, aes(gender, age_at_diagnosis / 365, fill = gender)) +
  geom_violin() +
  geom_boxplot()
```

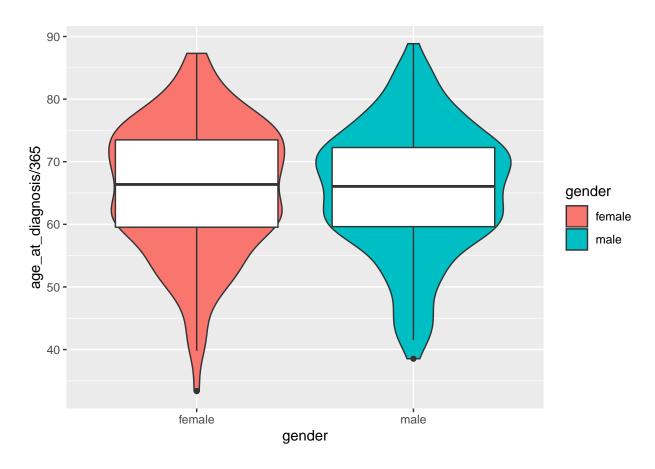

- ## Warning: Removed 37 rows containing non-finite values (stat_ydensity).
- ## Warning: Removed 37 rows containing non-finite values (stat_boxplot).

```
ggplot(d_luad, aes(gender, age_at_diagnosis / 365)) +
  geom_violin(aes(fill = gender)) +
  geom_boxplot(fill = 'white')
```

Warning: Removed 37 rows containing non-finite values (stat_ydensity).

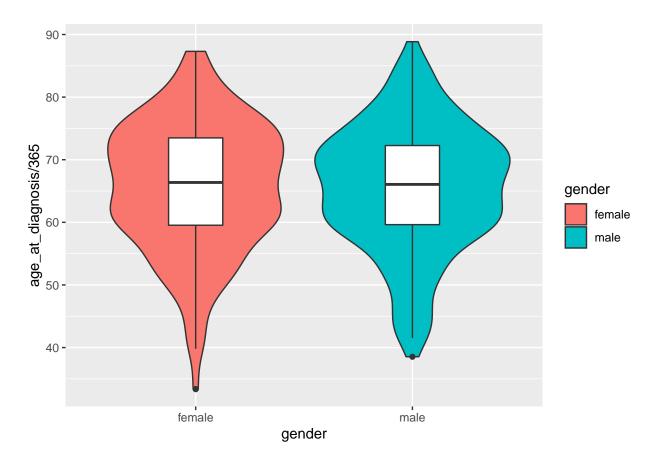

Warning: Removed 37 rows containing non-finite values (stat_boxplot).

```
ggplot(d_luad, aes(gender, age_at_diagnosis / 365)) +
  geom_violin(aes(fill = gender)) +
  geom_boxplot(fill = 'white', width = 0.25)
```

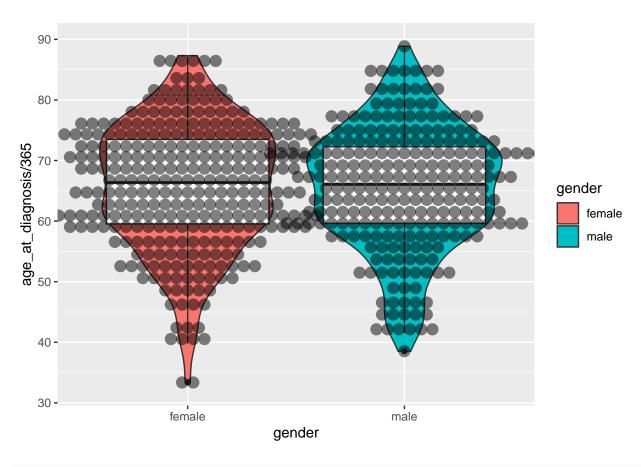

Warning: Removed 37 rows containing non-finite values (stat_ydensity).

Warning: Removed 37 rows containing non-finite values (stat_boxplot).

```
ggplot(d_luad, aes(gender, age_at_diagnosis / 365)) +
  geom_violin(aes(fill = gender)) +
  geom_boxplot(fill = 'white') +
  geom_dotplot(binaxis = 'y', stackdir = 'center', dotsize = 1, alpha = 0.5)
```

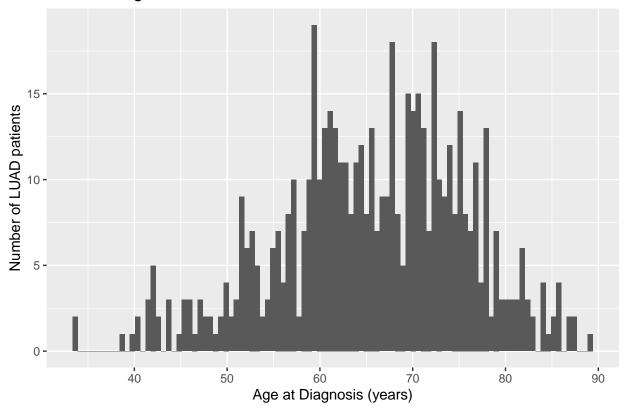

- ## Warning: Removed 37 rows containing non-finite values (stat_ydensity).
- ## Warning: Removed 37 rows containing non-finite values (stat_boxplot).
- ## Bin width defaults to 1/30 of the range of the data. Pick better value with `binwidth`.
- ## Warning: Removed 37 rows containing non-finite values (stat_bindot).

Do you think gender is the reason? If not, how about tumor stages?

Warning: Removed 37 rows containing non-finite values (stat_bin).

TCGA: Lung cancer adenocarcinoma

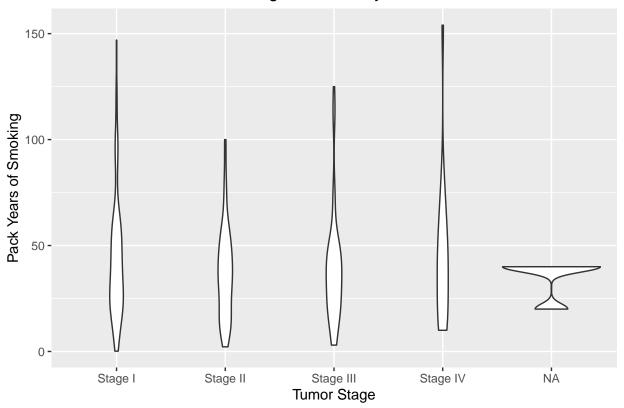

More tasks for the class.

Q1. Add labels for the plot.

```
d_luad %>% mutate(tumor_stage = case_when(
    ajcc_pathologic_stage %in% c("Stage I", "Stage IA", "Stage IB") ~ "Stage I",
    ajcc_pathologic_stage %in% c("Stage IIA", "Stage IIB") ~ "Stage II",
    ajcc_pathologic_stage %in% c("Stage IIIA", "Stage IIIB") ~ "Stage III",
    ajcc_pathologic_stage %in% c("Stage IV") ~ "Stage IV",
    TRUE ~ NA_character_)) %>%
    ggplot(aes(tumor_stage, pack_years_smoked)) +
    geom_violin() +
    labs(x = 'Tumor Stage', y = 'Pack Years of Smoking', title = 'Relation between Tumor Stage and Pack-years_smoked)
```

Warning: Removed 192 rows containing non-finite values (stat_ydensity).

Relation between Tumor Stage and Pack-year

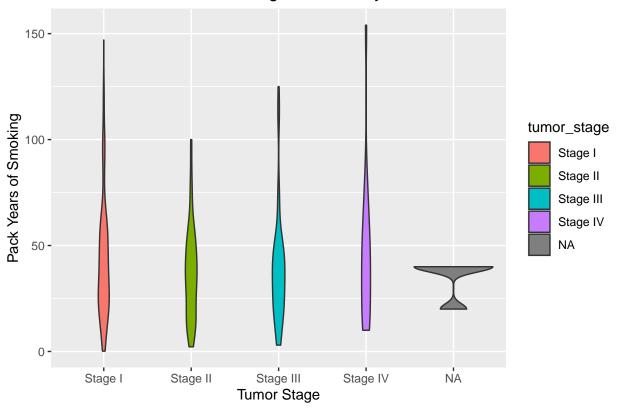

Q2. Change the color for categories.

```
d_luad %>% mutate(tumor_stage = case_when(
    ajcc_pathologic_stage %in% c("Stage I", "Stage IA", "Stage IB") ~ "Stage I",
    ajcc_pathologic_stage %in% c("Stage IIIA", "Stage IIIB") ~ "Stage III",
    ajcc_pathologic_stage %in% c("Stage IIIA", "Stage IIIB") ~ "Stage III",
    ajcc_pathologic_stage %in% c("Stage IV") ~ "Stage IV",
    TRUE ~ NA_character_)) %>%
    ggplot(aes(tumor_stage, pack_years_smoked)) +
    geom_violin(aes(fill = tumor_stage)) +
    labs(x = 'Tumor Stage', y = 'Pack Years of Smoking', title = 'Relation between Tumor Stage and Pack-years_smoked)
```

Warning: Removed 192 rows containing non-finite values (stat_ydensity).

Relation between Tumor Stage and Pack-year

Q3. Save to PDF file

```
p <- d_luad %>% mutate(tumor_stage = case_when(
    ajcc_pathologic_stage %in% c("Stage I", "Stage IA", "Stage IB") ~ "Stage I",
    ajcc_pathologic_stage %in% c("Stage IIA", "Stage IIB") ~ "Stage III",
    ajcc_pathologic_stage %in% c("Stage IIIA", "Stage IIIB") ~ "Stage III",
    ajcc_pathologic_stage %in% c("Stage IV") ~ "Stage IV",
    TRUE ~ NA_character_)) %>%
    ggplot(aes(tumor_stage, pack_years_smoked)) +
    geom_violin(aes(fill = tumor_stage)) +
    labs(x = 'Tumor Stage', y = 'Pack Years of Smoking', title = 'Relation between Tumor Stage and Pack-y stat_summary(fun.y=median, geom="point", size=2, color="red") +
    scale_fill_brewer(palette="Blues") + theme_classic()
```

Warning: `fun.y` is deprecated. Use `fun` instead.

```
ggsave('plot.Pack_Year.practice.pdf', p, width = 16, height = 9)
```

- ## Warning: Removed 192 rows containing non-finite values (stat_ydensity).
- ## Warning: Removed 192 rows containing non-finite values (stat_summary).
- Q4. Select the column with continuous information and plot the distribution by yourself.

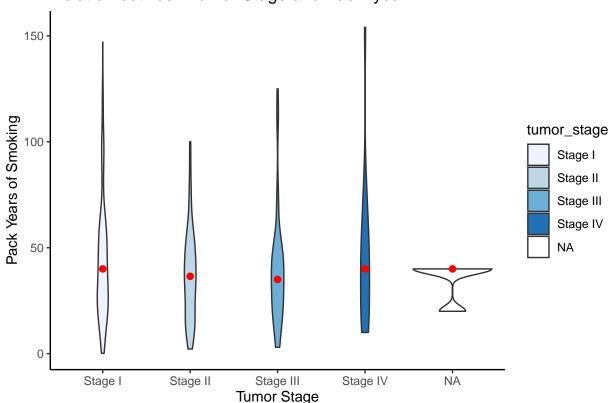

```
d_luad %>% mutate(tumor_stage = case_when(
    ajcc_pathologic_stage %in% c("Stage I", "Stage IA", "Stage IB") ~ "Stage I",
    ajcc_pathologic_stage %in% c("Stage IIA", "Stage IIB") ~ "Stage III",
    ajcc_pathologic_stage %in% c("Stage IIIA", "Stage IIIB") ~ "Stage III",
    ajcc_pathologic_stage %in% c("Stage IV") ~ "Stage IV",
    TRUE ~ NA_character_)) %>%
    ggplot(aes(tumor_stage, pack_years_smoked)) +
    geom_violin(aes(fill = tumor_stage)) +
    labs(x = 'Tumor Stage', y = 'Pack Years of Smoking', title = 'Relation between Tumor Stage and Pack-y stat_summary(fun.y=median, geom="point", size=2, color="red") +
    scale_fill_brewer(palette="Blues") + theme_classic()
```

Warning: `fun.y` is deprecated. Use `fun` instead.

Warning: Removed 192 rows containing non-finite values (stat_ydensity).

Warning: Removed 192 rows containing non-finite values (stat_summary).

Relation between Tumor Stage and Pack-year

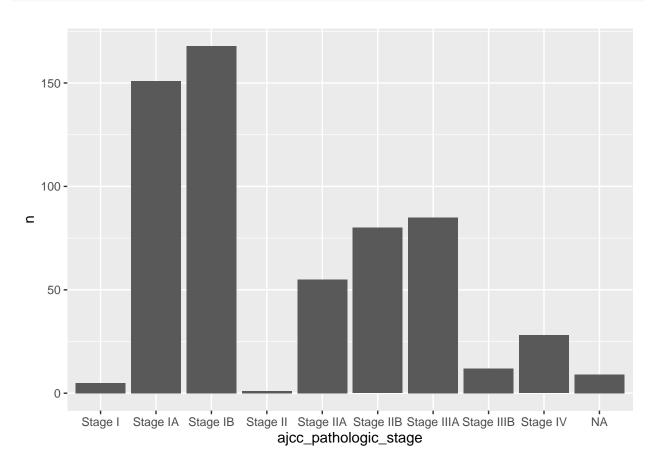

```
# save to file
ggsave('plot.TCGA_LUAD.histogram_AgeOfDX.20191002.pdf', p, width = 16, height = 9)
```

Warning: Removed 37 rows containing non-finite values (stat_bin).

3.3. Tumor stages of lung cancers

First information you might want to explore is staging cancers. Different types of staging systems are used for different types of cancer. You can read further information in general staging rules, or specifics in lung cancers (e.g. stage IA).

```
# Count the number of tumors in the LUAD dataset
counts_tumor <- d_luad %>% dplyr::count(ajcc_pathologic_stage)
# Try bar plot
ggplot(counts_tumor, aes(ajcc_pathologic_stage, n)) + geom_bar(stat = "identity")
```

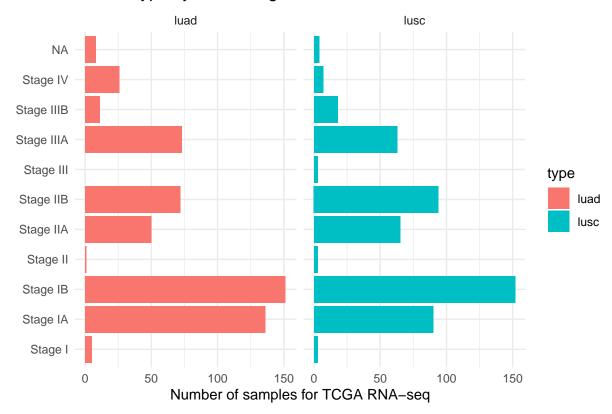

Now you can combine both for visualization.

```
d_lusc %>%
    filter(shortLetterCode == 'TP') %>%
    mutate(type = 'lusc') %>%
    select(type, ajcc_pathologic_stage)) %>%

dplyr::count(type, ajcc_pathologic_stage) %>%
mutate(tumor_stage = factor(ajcc_pathologic_stage, levels = rev(unique(ajcc_pathologic_stage)))) %>%
ggplot(aes(ajcc_pathologic_stage, n, fill = type)) +
labs(title = 'Cancer type by tumor stages',
    x = '', y = 'Number of samples for TCGA RNA-seq') +
theme_minimal() + geom_bar(stat = "identity") +
facet_wrap(~type) + coord_flip()
```

Cancer type by tumor stages

3.4. Cancer type by gender

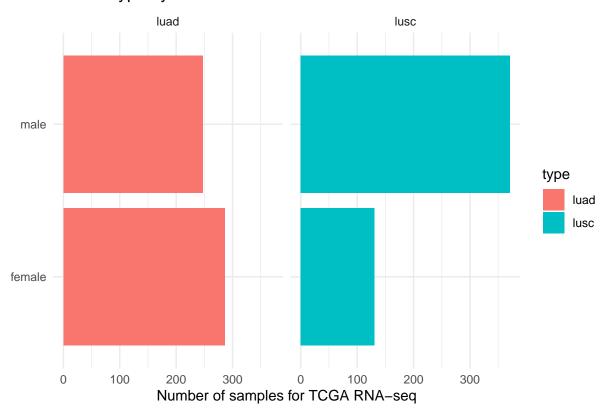

Let's try another information - gender. We will describe this by a bar plot like above. After plotting, which information you can read from this?

NB: I am not pretty sure why TCGA put gender, not sex in the dataset, in addition to mixed use of female/male with gender.

```
d_lusc %>%
    filter(shortLetterCode == 'TP') %>%
    mutate(type = 'lusc') %>%
    select(type, gender)) %>%

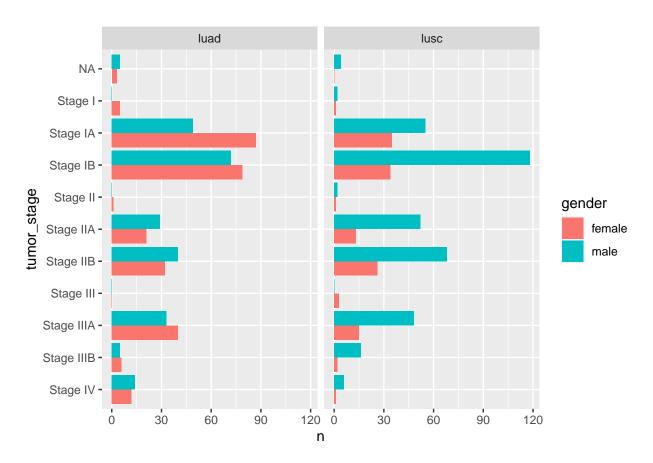

dplyr::count(type, gender) %>%
ggplot(aes(gender, n, fill = type)) +
labs(title = 'Cancer type by Sex',
    x = '', y = 'Number of samples for TCGA RNA-seq') +
theme_minimal() + geom_bar(stat = "identity") +
facet_wrap(~type) + coord_flip()
```

Cancer type by Sex

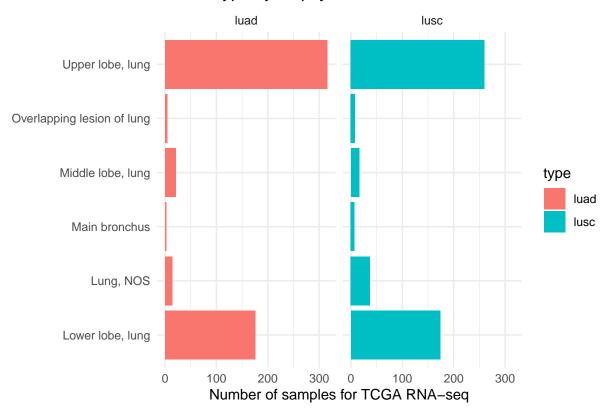

Is there difference in tumor stages by gender? Let's check with LUSC.

```
ggplot(., aes(tumor_stage, n, fill = gender)) +
geom_bar(stat = "identity", position = position_dodge()) +
facet_wrap(~type) + coord_flip()
```

3.5. Site of biopsy

Cancer type by biopsy

Plot the years at diagnosis by tissue or organ of origin. We would also include difference by gender.

```
bind_rows(d_luad %>%
    filter(shortLetterCode == 'TP') %>%
    mutate(type = 'luad') %>%
    select(type, gender, age_at_diagnosis, tissue_or_organ_of_origin),
    d_lusc %>%
        filter(shortLetterCode == 'TP') %>%
        mutate(type = 'lusc') %>%
        select(type, gender, age_at_diagnosis, tissue_or_organ_of_origin)) %>%
        ggplot(., aes(gender, age_at_diagnosis / 365, fill = gender)) +
        geom_boxplot() + labs(y = 'year at diagnosis') +
        facet_wrap(~tissue_or_organ_of_origin)
```

Warning: Removed 40 rows containing non-finite values (stat_boxplot).
